

## ABSTRACT

1 A multi-sectored, multiple access communication system  
2 provides for low-skew sector transceiver clocks by  
3 novelly utilizing a multi-tap digital Phase-Locked Loop  
4 (PLL) in the delay match circuitry of each transceiver to  
5 efficiently and inexpensively generate clock signals for  
6 each transceiver that are temporally aligned within  
7 acceptable limits of the other transceivers. The  
8 inventive system and method obviate the need for matching  
9 the lengths of all of the cables connecting the base  
10 station ("master sector equipment") to the transceivers  
11 ("slave sector equipment"), and also reduces the power  
12 requirement as a byproduct.
